6.5 Selected Open Source Software Development

The following is a list of software designed, implemented, and made available as open source software.

dgsh The directed graph shell, provides an expressive way to construct sophisticated and efficient big data processing pipelines using existing Unix tools as well as custom-built components. It is a Unix-style shell allowing the specification of pipelines with non-linear scatter-gather operations. These form a directed acyclic process graph, which is typically executed by multiple processor cores, thus increasing the operation’s processing throughput.

UMLGraph allows the declarative specification and drawing of a number of UML diagrams. My *IEEE Software* article titled “On the declarative specification of models” (March/April 2003) explains the rationale behind this approach. In addition, the UMLGraphDoc doclet included in the software’s distribution automatically adds UML diagrams to javadoc documentation.

CScout is a source code analyzer and refactoring browser for collections of C programs. It can process workspaces of multiple projects mapping the complexity introduced by the C preprocessor back into the original C source code files. CScout takes advantage of modern hardware advances (fast processors and

large memory capacities) to analyze C source code beyond the level of detail and accuracy provided by current compilers and linkers. CScout has been applied on projects ranging from tens of thousands of lines, like the Apache web server, to millions of lines, like the Linux, FreeBSD, Solaris, and the Windows Research kernels.

Unix sed(1) Stream Editor is a POSIX compliant re-implementation of the Unix sed(1) stream editor. Part of macOS, 4.4BSD, NetBSD, and FreeBSD.

FreeBSD contributions As a committer to the FreeBSD operating system I contributed the following:

- a new kernel process accounting record format which increases precision of time values while maintaining backward compatibility with legacy file and record formats;
- a pipe sub-namespace to the portal file system;
- the 8255 parallel peripheral interface basic I/O driver;
- small functionality improvements to killall(1), lastcomm(1), ppp(8), and sa(8);
- bug fixes to bdes(1), date(1), echo(1), finger(1), jot(1), mv(1), restore(1), sed(1), mmap(2), utimes(2), getnetbydns(3), initgroups(3), login_cap(3), regex(3), syslog(3), crontab(8), sa(8), and the kernel's tty and NFS client code;
- code style fixes to indent(1), jot(1), mail(1), sh(1), tsort(1), and the kernel's vnode interface, networking, and sound PCM code;
- regression testing improvements or support to jot(1), lastcomm(1), mv(1), sed(1), and sa(8);
- documentation fixes to mkstr(1), mail(1), connect(2), open(2), read(2), recv(2), select(2), stat(2), write(2), and pstat(8).
